

Ben is 14 years old and has a severe neurological disorder which severely impairs his daily life. He has been under treatment for a while with a once-weekly injection that needs to be administered by a healthcare professional.

Ben is now informed that he has access to an extended-release formulation, which reduces the administration frequency from a once-weekly to a 3-monthly injection. This new formulation significantly increased the convenience of its use and could potentially improve adherence by Ben and fellow patients.

The 3-monthly formulation therefore not only addresses an unmet medical need from a patient perspective, by improving Ben's quality of life, but also addresses it from a healthcare system perspective, by decreasing the burden on the healthcare system.

Furthermore, the increased convenience and consequent adherence can have a positive effect on treatment response by patients like Ben.

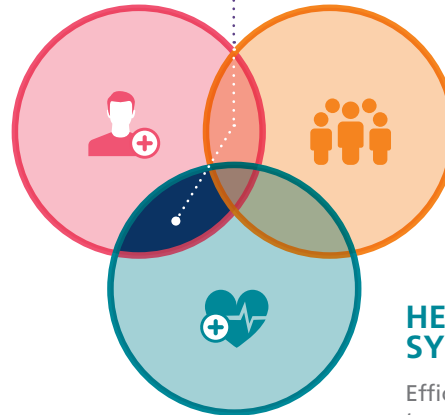

UMN INDICATOR*

PATIENT	SOCIETY	HC SYSTEM

*the positions are indicative and meant for illustrative purposes only

PATIENT PERSPECTIVE

Burden of disease at the level of the individual

SOCIETAL PERSPECTIVE

Prevalence in combination with BoD (population level)

HEALTHCARE SYSTEM PERSPECTIVE

Efficiency, cost-effectiveness of treatments etc.
